TABLE OF CONTENTS

Watson Industries prides itself on solving customer problems and serving their needs in a timely fashion. This manual is intended to facilitate this goal and to provide written information about your product. We ask that you carefully read this manual. Becoming familiar with the manual will help you understand the product's capabilities and limitations, as well as provide you with a basic understanding of its operation. If, after reading the manual, you require further assistance, do not hesitate to call Watson Industries with your questions and comments.

CAUTION!

Watson Sensors are rugged devices that have been used successfully in a number of harsh environments. The components have been qualified to withstand a mechanical shock of 200g 's or greater, and most enclosures provide an added level of protection. However, dropping a sensor from waist height onto a hard floor can cause a shock level of 600g's. At this level, damage is likely to occur.

Introduction

The GPS Gyro Compass System (GGC-E101) is a solid-state sensor system that provides the user with dynamic measurements of Angular Attitude and Heading, together with GPS output messages. This System consists of a DMS unit and two mounted GPS antennas inside a water-resistant carry case.

Product Description

Watson Industries GGC-E101 uses solid-state gyros and silicon accelerometers. The solid state vibrating structure angular rate gyros used in this system provide extremely high reliability, high precision, low power consumption and shock resistance. There are no physical adjustments required by the user since all of the primary transducers are locked into position during manufacture.

The GGC-E101 incorporates a dual antenna Differential GPS (DGPS) system that allows the GGC to output true North heading. This unit outputs Altitude, Latitude and Longitude based on the position of the aft antenna.

This unit will operate in two heading modes. The unit operates in true North heading mode ("G" label header on output message) when in dual antenna GPS is valid. In the event of loss of the GPS signal, the unit switches to relative heading ("I" label header on output message) based on the last accurate GPS heading. When GPS signal is restored, the unit reverts to true North heading when dual antenna GPS is restored. The user may select to hold the unit in relative heading mode full time. (See Appendix B Setting Heading Mode)

Installation

Environment

Avoid mounting sites that are subject to significant temperature changes over the duration of the test. Temperature variation could induce noticeable rate sensor bias drift, which could result in degraded attitude accuracy.

This sensor system is housed in a water-resistant case. This case is air transportable and buoyant.

The GGC is a rugged device and will withstand harsh environments. However, due attention needs to be paid to the nature of the sensor and its prime function, which is to measure attitude and motion.

Calibration

 The GGC is calibrated at the factory before it is shipped to the user. It is recommended that the unit be returned to the factory annually for evaluation and recalibration.

Orientation

The GGC unit side that has the carrying handle needs to be aligned along the heading direction. See Figure 1.

Heading Direction
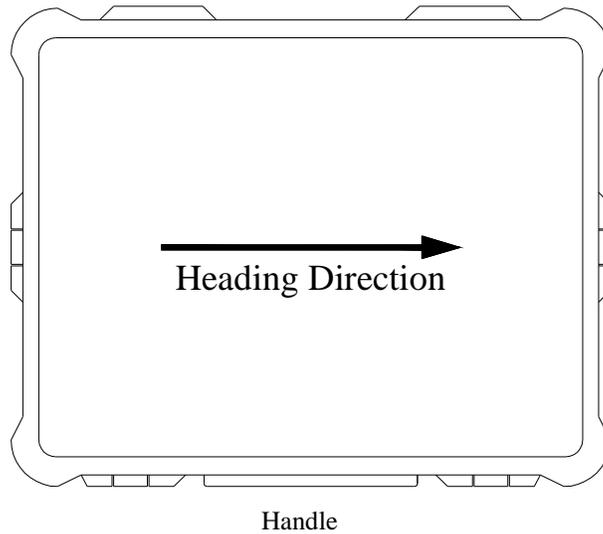

Figure 1 –   *Alignment*

Handle

Mounting

The GGC-E101 case needs to be placed on a flat horizontal surface. Unsnapping the four plastic clasps opens the GGC case. The case cover needs to be fully opened so that the cover is below the antennas when they are deployed to avoid interference with the GPS satellite signals.

Power / Connectors

This unit has an internal regulator to allow operation over a wide voltage input range. Best operation is obtained at either 24 or 28 VDC, although operation is fully satisfactory down to 15 VDC and up to 35 VDC. Power draw of the unit is about 7 Watts. The GGC power system is isolated from the GGC signal system. The 65-meter mating cable (GGC Cable –65) for this unit is included and coiled inside the lid. This cable needs to be attached to a power supply and a computer to receive data. The cable is removed by opening the five straps that secure the cable. The necessary length of cable can then be uncoiled. The Red and Black wires need to be connected to the DC power Supply. The Orange, White and Brown wires need to be connected to the RS-232 port of data collection computer. For more information on the cable hookup see page 17.

Wire straps

Metal clasp

Antenna assembly straps

Antenna arm

Figure 2 – GGC-E101 Stowed

Deployment

After the unit is aligned and connections have been completed, the antennas can be deployed. See Figure 3 for information on deploying the antennas. First open the two straps that secure the antenna assembly. Now pivot the assembly up and toward the side of the case. Be careful not to pinch your fingers between the antenna assembly and case side. Next swing the left-hand antenna arm counterclockwise until it is fully extended. Please note that the antenna arms are secured with Velcro patches. Use the left-hand metal clasp to secure this antenna arm in its extended position. Now swing the right-hand antenna arm counterclockwise until it is fully extended. Use the right-hand metal clasp to secure this antenna arm in its extended position. The GGC needs an

unobstructed view of the entire sky to receive signals from GPS satellites. The GGC is now ready to operate. See the Operation Section on page 8.

Step 1 – Open Case

Step 2 – Raise Antenna Assembly

Step 3 – Extend antenna arms and secure metal clasps
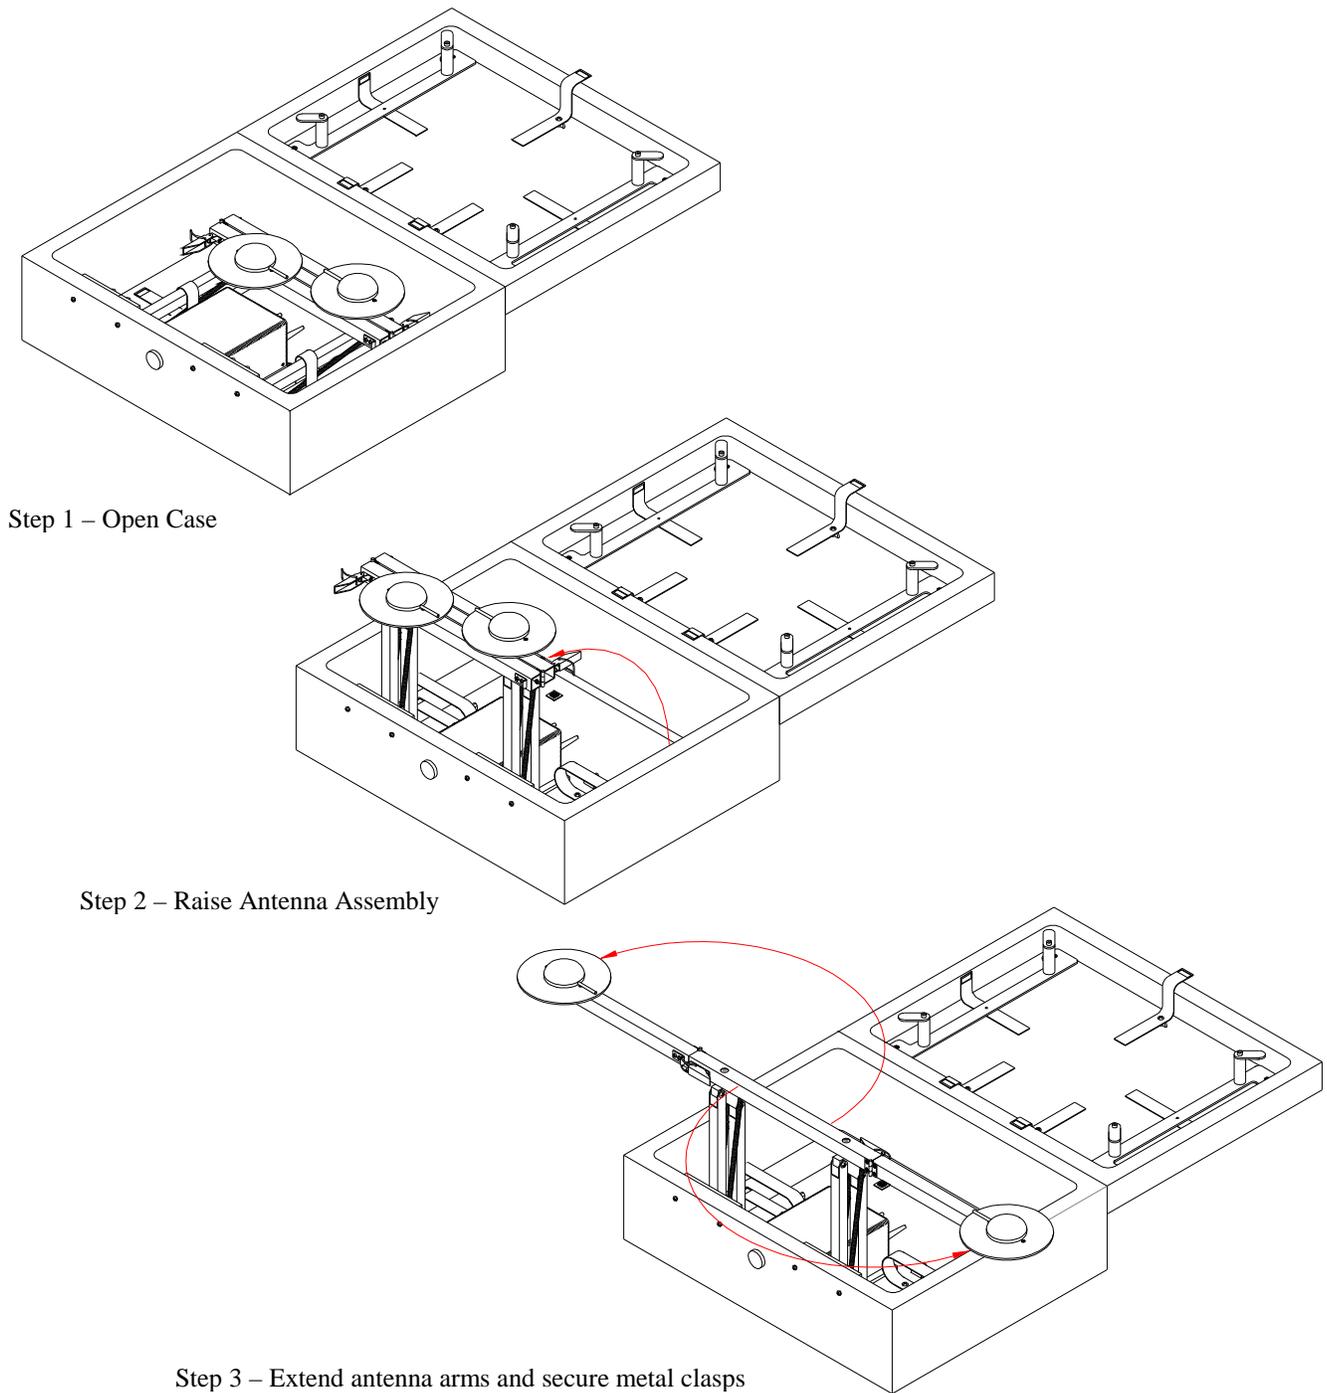

Figure 3 – Deployment

Stowing

 When finished taking measurements with the GGC it is time to repack the unit. First shutoff the DC power supply to the unit and remove Red and black wires from power supply. Next disconnect

the RS-232 serial connection to the computer. See Figure 4 for information for help in stowing the antenna assembly and cable. Now unclasp the right-hand antenna and swing the antenna arm clockwise to the stowed position. Next unclasp the left-hand antenna and swing the antenna arm clockwise to the stowed position. Make sure the two straps that secure the antenna assembly are open and out of the way. Pivot the antenna assembly down and into the bottom of the case. Be careful not to pinch your fingers between the antenna assembly and case bottom. Now the antenna assembly can be secured by closing the straps. Next the Power/signal cable needs to be stowed. Make sure the five straps that secure the cable are open and out of the way. Rewind the cable onto its holder inside the cover. Secure the cable by closing the five straps. Close the cover and secure by snapping the four plastic clasps.
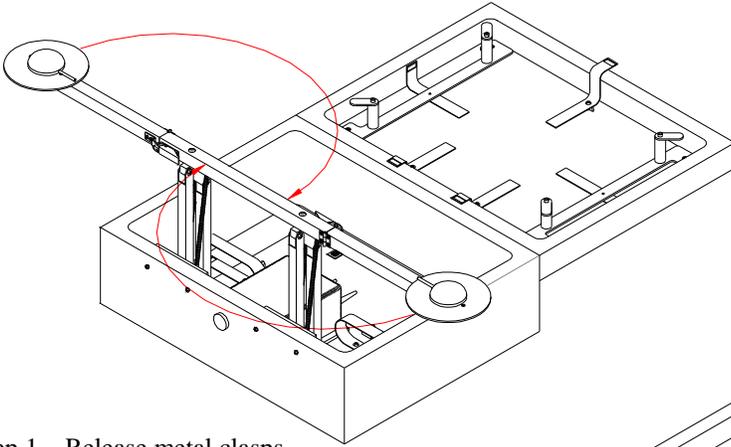

Step 1 – Release metal clasps and stow antenna arms.
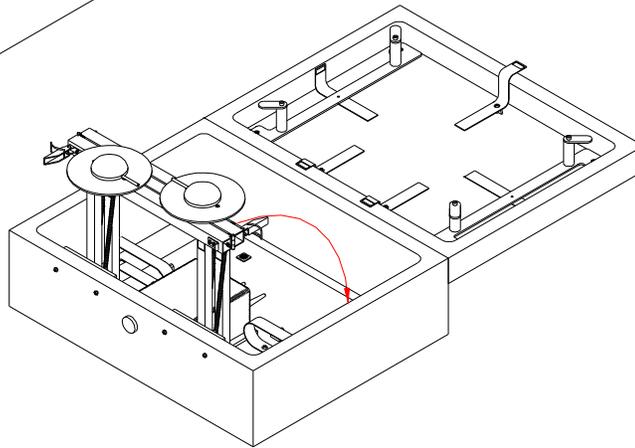

Step 2 – Lower Antenna Assembly
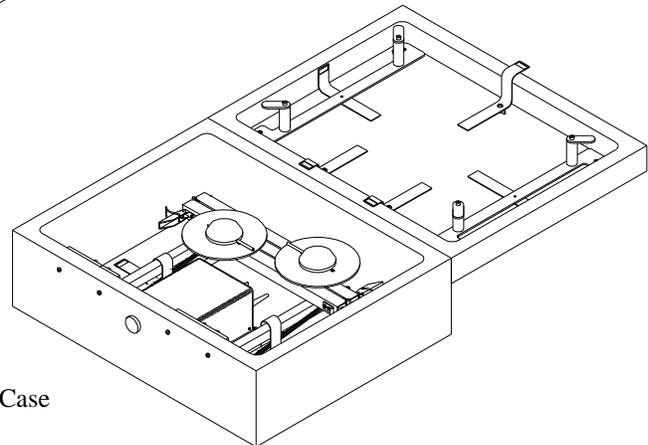

Step 3 – Close Case

Figure 4 – Stowing

Operation

Power Up

The GGC unit output messages can be read by using a terminal program. Now it is time to power up the data collection computer and start the terminal program for the serial port connected to the GGC. Next the power needs to be switched on for the GGC unit.

Figure 5 – GGC-E101 Deployed

Initialization

Ideally, the GGC should be stationary and level when it is turned on. If not, the sensor readings may not be immediately accurate after initialization. The time required for the initialization process takes 4 to 5 seconds. During this time, a message is sent from the unit via the RS-232 serial link. This message gives information about the GGC such as the full model number, serial number, and software revision.

Example of the GGC header:

```
GGC-E101   INITIALIZING
SERIAL NUMBER - 0177
LAST CALIBRATED - 10/12/10
SOFTWARE VERSION - GG01_00A  2010-12-13
COPYRIGHT (C) 1990 THROUGH 2010
WATSON INDUSTRIES, INC.
```

Normal Operation

During normal operation, the GGC will output highly accurate inertial data for the user to interpret. This data is transmitted using the RS-232 serial output. The unit also relays GPS messages. The exact formatting structure is discussed later in the Interface section of this manual.

In normal operation, the GGC takes data from its rate sensors and integrates in a closed loop system, with the accelerometers as a long-term reference, to generate Bank, Elevation and Heading data. In most cases, these algorithms provide for very stable and accurate output signals; however, the user should be aware that exceeding the normal ranges of the sensors would affect accuracy. The GGC gyros have a maximum rate of 100°/s. Care should be taken not to exceed this rate because the closed loop system will receive inaccurate data. This will result in errors in the angle output signals. The GPS Velocity data is used to assist in the correction of errors. The internal GPS receiving unit provides this signal.

The Heading Angle is referenced to the fore-aft alignment of the two GPS antennas using the true North GPS Heading (the string start label is "G"). If GPS becomes unavailable, relative heading will be maintained (the string start label is "I").

While this GGC is "all attitude", the accuracy deteriorates rapidly when its forward direction is within about 5 degrees of vertical. Operation for any extended period of time in this orientation is not recommended. If these few operational precautions are observed, the GGC should provide very accurate data for a wide variety of applications.

Standard RS-232 Digital Output

The standard RS-232 output consists of a five NMEA GPS messages. These strings of decimal ASCII characters sent asynchronously at regular intervals. Nominally, the string is sent at 9600 baud with eight data bits, one stop bit and no parity. The mating cable for the GGC is included. The RS-232 signal is referenced to signal ground. The frame rate is 1 frame of five GPS messages per second. The five GPS messages are GPHDT, GPGGA, GPGLL, GPVTG, GPRMC. The unit is shipped configured for this output.

Here is an example of the five string frame:

```
$GPHDT,175.58,T*0C
$GPGGA,175612.00,4451.84239,N,09128.00147,W,2,06,1.1,275.2,M,-33.0,M,6.0,0133*7B
$GPGLL,4451.84239,N,09128.00147,W,175612.00,A,D*78
$GPVTG,186.55,T,187.35,M,0.13,N,0.24,K,D*25
$GPRMC,175612.00,A,4451.84239,N,09128.00147,W,0.13,186.55,081210,0.8,W,D*39
```

$GPHDT Message Format

The $GPHDT consists of a string ASCII characters sent asynchronously at regular intervals. The string is sent at 9600 baud with eight data bits, one stop bit and no parity. The contents of this string are formed as follows:
$GPHDT,xxx.xx,T*cc<CR><LF>

1.   The "$GPHDT" header indicates the start of the data string. . This data is followed by a comma.

2.   "xxx.xx" is a variable character string (minimum-4, maximum-6) representing the gyro stabilized true North heading 0.00 to 359.99 degrees. This data is followed by a comma.

3.   "T" is a single character representing the true North heading.

4.   "*cc" is a three character string representing an asterisk followed by a two digit hexadecimal checksum.

5.   <CR><LF> The string is terminated by a carriage return and Line Feed. There will then be a short interval with no data transmission before the next string begins.

Example:
$GPHDT,175.58,T*0C

```
$GPHDT  ← message Header
     175.58  ← True Heading 175.58 deg
           T  ← True Heading
            *0C  ← Checksum
```

$GPGGA Message Format

The $GPGGA consists of a string ASCII characters sent asynchronously at regular intervals. The string is sent at 9600 baud with eight data bits, one stop bit and no parity. The contents of this string are formed as follows:
$GPGGA,hhmmss.ss,ddmm.mmmmm,s,dddmm.mmmmm,s,n,qq,p.p,saaaaa.a,M,
±xxxx.xx,M,sss,aaaa*cc<CR><LF>

1.   The "$GPGGA" header indicates the start of the data string. This data is followed by a comma.

2.   "hhmmss.ss" is a nine character string representing the Universal time in "hh" hours, "mm" minutes, " ss" seconds and ".ss" decimal fraction seconds at the GPS position. This data is followed by a comma.

3.   "ddmm.mmmmm" is a nine character string representing the Latitude in "dd" degrees, "mm" minutes, and ".mmmmm" decimal fraction minutes. This data is followed by a comma.

4.   "s" is a single character representing the Latitude direction. s = N for North Latitude, s = S for South Latitude. This data is followed by a comma.

5.   "dddmm.mmmmm" is an eleven character string representing the Longitude in "ddd" degrees, "mm" minutes, and ".mmmmm" decimal fraction minutes. This data is followed by a comma.

6.   "s" is a single character representing the Longitude direction. s = E for East Longitude, s = W for West Longitude. This data is followed by a comma.

7.   "n" is a single character representing the Quality indicator. n = 0 for no position, n = 1 for undifferentially correction position, n = 2 for differentially correction position, 9 = position computed using almanac. This data is followed by a comma.

8.   "qq" is two characters representing the number of satellites used in position computation. This data is followed by a comma.

9.   "p.p" is a three character string representing the Horizontal Dilution of Precision (HDOP) = 1.0 to 9.9. This data is followed by a comma.

10.   "saaaaa.a" is a variable character string (minimum-3, maximum-8) representing the Antenna Altitude in meters above sea level. This data is followed by a comma.

11.   "M" is the altitude units, meters. This data is followed by a comma.

12.   "±xxxx.x" is a variable character string (minimum-4, maximum-7) representing the geoidal separation in meters. It difference between the WGS-84 earth ellipsoid and mean-sea-level (geoid). This data is followed by a comma.

13.   "M" is the geoidal separation units, meters. This data is followed by a comma

14.   "sss" is a variable character string (minimum-0, maximum-3) representing the age of Differential Corrections in seconds. Field blank if not Differentially corrected. . This data is followed by a comma

15.   "aaaa" is a four character string representing Reference station identification (0000 – 1023). Field blank if not Differentially corrected.

16.   "*cc" is a three character string representing an asterisk followed by a two digit hexadecimal checksum.

17.   <CR><LF> The string is terminated by a carriage return and Line Feed. There will then be a short interval with no data transmission before the next string begins.

Example:
$GPGGA,175612.00,4451.84239,N,09128.00147,W,2,06,1.1,275.2,M,-33.0,M,6.0,0133*7B

$GPGGA ← message Header
        175612.00← Universal Time 17 Hrs 56 minutes 12.00 seconds
                4451.84239 ← Latitude 44 deg 51.84239 minutes
                        N ← North Latitude
                    09128.00147← Longitude 91 deg 28.00147 minutes
                            W ← West Longitude
                            2 ← Quality factor = 2 Diff. Corrected Pos.

```
                    06 ← 6 satellites being used
                   1.1← HDOP = 1.1
                    275.2,M← Altitude = 275.2 Meters
   geoidal separation –33.0 meters → -33.0,M
   Differential Correction Age= 6.0 seconds → 6.0
            Reference Station Identification → 0133
                        Checksum → *7B
```

$GPGLL Message Format

The $GPGLL consists of a string ASCII characters sent asynchronously at regular intervals. The string is sent at 9600 baud with eight data bits, one stop bit and no parity. The contents of this string are formed as follows:

$GPGLL,ddmm.mmmmm,s,dddmm.mmmmm,s,hhmmss.ss,a,i*cc<CR><LF>

1. The "$GPGLL" header indicates the start of the data string. This data is followed by a comma.

2. "ddmm.mmmmm" is a nine character string representing the Latitude in "dd" degrees, "mm" minutes, and ".mmmmm" decimal fraction minutes. This data is followed by a comma.

3. "s" is a single character representing the Latitude direction. s = N for North Latitude, s = S for South Latitude. This data is followed by a comma.

4. "dddmm.mmmmm" is an eleven character string representing the Longitude in "ddd" degrees, "mm" minutes, and ".mmmmm" decimal fraction minutes. This data is followed by a comma.

5. "s" is a single character representing the Longitude direction. s = E for East Longitude, s = W for West Longitude. This data is followed by a comma.

6. "hhmmss.ss" is a nine character string representing the Universal time in "hh" hours, "mm" minutes, " ss" seconds and ".ss" decimal fraction seconds at the GPS position. This data is followed by a comma.

7. "a" is a single character representing the Status. a = A for data valid, a = V for data invalid. This data is followed by a comma

8. "i" is a single character representing the Mode Indicator. i = A for Autonomous, i = D for Differential, i = E for Estimated.

9. "*cc" is a three character string representing an asterisk followed by a two digit hexadecimal checksum.

10. <CR><LF> The string is terminated by a carriage return and Line Feed. There will then be a short interval with no data transmission before the next string begins.

Example:
```
$GPGLL,4451.84239,N,09128.00147,W,175612.00,A,D*78
```

```
$GPGLL   ← message Header
       4451.84239← Latitude 44 deg 51.84239 minutes
                N ← North Latitude
                  09128.00147 ← Longitude 91 deg 28.00147 minutes
                            W ← West Longitude
                              175612.00← Universal Time 17 Hrs 56 min 12.00 sec
                                       A ← Status = valid data
                                        D ← Mode Indicator = Differential
                                         *78 ← Checksum
```

$GPVTG Message Format

The $GPVTG consists of a string ASCII characters sent asynchronously at regular intervals. The string is sent at 9600 baud with eight data bits, one stop bit and no parity. The contents of this string are formed as follows:
$GPVTG,ttt.tt,c,ttt.tt,c,ggg.gg,u,ggg.gg,u,i*cc<CR><LF>

1.   The "$GPVTG" header indicates the start of the data string. . This data is followed by a comma.

2.   "ttt.tt" is a variable character string (minimum-4, maximum-6) representing the True course over ground. 0.00 to 359.99 degrees. This data is followed by a comma.

3.   "c" is a single character representing true course over ground indicator.
       c = T (always) for True Heading. This data is followed by a comma.

4.   "ttt.tt" is a variable character string (minimum-4, maximum-6) representing the Magnetic course over ground. 0.00 to 359.99 degrees. This data is followed by a comma.

5.   "c" is a single character representing magnetic course over ground indicator.
       c = M (always) for Magnetic Heading. This data is followed by a comma.

6.   "ggg.gg" is a variable character string (minimum-4, maximum-6) representing the speed over ground. 0.00 to 999.99 knots. This data is followed by a comma.

7.   "u" is a single character representing speed over ground units.
       u = N (always) for Nautical mile/hour. This data is followed by a comma.

8.   "ggg.gg" is a variable character string (minimum-4, maximum-6) representing the speed over ground. 0.00 to 999.99 km/hour. This data is followed by a comma.

9.   "u" is a single character representing speed over ground units.
       u = K(always) for kilometer/hour. This data is followed by a comma.

10.   "i" is a single character representing the Mode Indicator. i = A for Autonomous, i = D for Differential, i = E for Estimated.

11. "*cc" is a three character string representing an asterisk followed by a two digit hexadecimal checksum.

12. <CR><LF> The string is terminated by a carriage return and Line Feed. There will then be a short interval with no data transmission before the next string begins.

Example:
```
$GPVTG,186.55,T,187.35,M,0.13,N,0.24,K,D*25
```

```
$GPVTG ← message Header
      186.55← True Course over ground 261.74 degrees
             T ← True Heading
           187.35← Magnetic Course over ground 262.26 degrees
                  M ← Magnetic Heading
               0.13← Speed over ground 0.13 knots
                     N ← Knots
                  0.24 ← Speed over ground 0.24 Km/hr
                       K ← Km/hr
                        D ← Mode Indicator = Differential
                       *25 ← Checksum
```

$GPRMC Message Format

The $GPRMC consists of a string ASCII characters sent asynchronously at regular intervals. The string is sent at 9600 baud with eight data bits, one stop bit and no parity. The contents of this string are formed as follows:
$GPRMC,hhmmss.ss,ddmm.mmmmm,s,dddmm.mmmmm,s,zzz.zz,ttt.tt,ddmmyy,ddd.d,v, i*cc<CR> <LF>

1. The "$GPRMC" header indicates the start of the data string. This data is followed by a comma.

2. "hhmmss.ss" is a nine character string representing the Universal time in "hh" hours, "mm" minutes, " ss" seconds and ".ss" decimal fraction seconds at the GPS position. This data is followed by a comma.

3. "a" is a single character representing the Status. a = A for data valid,
a = V for data invalid. This data is followed by a comma

4 "ddmm.mmmmm" is a nine character string representing the Latitude in "dd" degrees, "mm"minutes, and ".mmmmm" decimal fraction minutes. This data is followed by a comma.

5. "s" is a single character representing the Latitude direction. s = N for North Latitude, s = S for South Latitude. This data is followed by a comma.

6. "dddmm.mmmmm" is an eleven character string representing the Longitude in "ddd" degrees, "mm" minutes, and ".mmmmm" decimal fraction minutes. This data is followed by a comma.

7. "s" is a single character representing the Longitude direction. s = E for East Longitude, s = W for West Longitude. This data is followed by a comma.

8. "zzz.zz" is a variable character string (minimum-4, maximum-6) representing the ground speed. 0.00 to 999.99 knots. This data is followed by a comma.

9. "ttt.tt" is a variable character string (minimum-4, maximum-6) representing the Track made good, referenced to true North.. 0.00 to 359.99 degrees. This data is followed by a comma.

10. "ddmmyy" is a six character string representing the UTC date of position fix. "dd" day, "mm" month, "yy" year . This data is followed by a comma.

11. "ddd.d" is a variable character string (minimum-3, maximum-5) representing Magnetic Variation 0.0 to 180.0 degrees. This data is followed by a comma.

12. "v" is a single character representing the Magnetic Variation direction. s = E for East Longitude, s = W for West Longitude. This data is followed by a comma.

13. "i" is a single character representing the Mode Indicator. i = A for Autonomous, i = D for Differential, i = E for Estimated.

14. "*cc" is a three character string representing an asterisk followed by a two digit hexadecimal checksum.

15. <CR><LF> The string is terminated by a carriage return and Line Feed. There will then be a short interval with no data transmission before the next string begins.

Example:
```
$GPRMC,175612.00,A,4451.84239,N,09128.00147,W,0.13,186.55,081210,0.8,W,D*39
```

```
$GPRMC ← message Header
       175612.00← Universal Time  21 Hrs 46 minutes 57.00 seconds
                 A ← Status = valid data
                   4451.84239← latitude 44 deg 51.84043 minutes
                             N ← North Lattitude
                              09128.00147← Longitude 91 deg 28.00263 minutes
                                         W ← West Longitude
                                          0.13 Speed over ground 0.13 knots
               Track Made Good 186.55 degrees → 186.55
            UTC Date of postion fix 08 December 2010 → 081210
                           Magnetic Variation 0.8 degrees → 0.8
                                 West Magnetic Variation → W
                            Mode indicator = Differential → D
                                                        *39 ← Checksum
```

Optional RS-232 Digital Output

The optional RS-232 output consists of a string of decimal ASCII characters sent asynchronously at regular intervals. Nominally, the string is sent at 9600 baud with eight data bits, one stop bit and no parity. The mating cable for the GGC is included. The RS-232 signal is referenced to signal ground. The frame rate is 10 strings per second. See Appendices A and B for information on how to change the unit for this output. The contents of a string are formed as follows:

1.   A single letter and a space used to indicate the start of the data string. The letter "G" indicates the start of an inertial data string with successful GPS data input. The letter "I" indicates the start of an inertial data string with GPS disabled or absence of valid GPS data. The letter "R" indicates the start of a Reference data string. If the letter is in lower case ("g","i", or "r"), an error over-range condition is indicated

   This occurs when the calculated attitude or heading errors exceed preset ranges. Internal functions that require these error values are disabled while the condition exists. The system will continue to operate in an extended time constant mode with a low level of error accumulation until the condition is cleared. While maneuvering, occasional blips of this condition are expected with no detectable effect on the resulting data.

2.   A nine character string representing the Universal Time (UTC) starting with six digits, a decimal point, one digit and a space for up to 235959.9 Hours minutes seconds tenth seconds (HHMMSS.S). Note: The field is filled with asterisks when the data is invalid. ("******.*")

3.   A seven character string representing the bank angle starting with a "+" or a "-", followed by three digits, a decimal point, one digit and a space for up to ±179.9 degrees.

4.   A six character string representing the elevation angle starting with a "+" or a "-", followed by two digits, a decimal point, one digit and a space for up to ±89.9 degrees.

5.   A six character string representing the heading angle by three digits, a decimal point, one digit and a space for zero to 359.9 degrees.

6.   A seven character string representing the GPS Ground Track/Forward Velocity starting with a "+" or a "-", followed by three digits, a decimal point, one digit and a space for up to ±399.9 Km/Hr. Note: The field is filled with asterisks when the data is invalid. ("****.*")

7.   A twelve character string representing the Latitude starting four digits, a decimal point, five digits, a comma, followed by an "N" or "S" and a space for up to ±89degrees 59.99999 minutes North or South. Note: The field is filled with asterisks when the data is invalid. ("****.****,*")

8.   A thirteen character string representing the longitude starting with a five digits, a decimal point, five digits, a comma, followed by a "W" or "E" and a space for up to 179 degrees 59.99999 minutes East or West. The field is filled with asterisks when the data is invalid. ("*****.*****,*")

9.   A six character string representing the Altitude by five digits and a space for up to 21500 feet. The field is filled with asterisks when the data is invalid. ("*****").

10. The string is terminated by a carriage return. There will then be a short interval with no data transmission before the next string begins.

Example:

G   161409.9   -000.8   +00.1   273.4   +028.9   4451.84413,N   09128.00182,W   00894   <CR>

| (1) | UTC (2) | Bank angle (3) | Elev. angle (4) | Head. angle (5) | Velocity (6) | Latitude (7) | Longitude (8) | Altitude (9) | (10) |

space   space   space   space   space   space   space   space

Mating Cable / Connections

The GGC-E101 is supplied with a 65 meter mating Cable (Part Number: GGC Cable –65). This cable terminated at one end with mating 10 pin MIL-C-26482 connector (MS3116F12-10S) and four inch wire lead (1" stripped and tinned) at the other end.

7 conductor mating Cable

Connector Pin	Wire Color	Description
A	Black	Power Ground
B	Red	V+ Power In
C	No Connection	Not Used
D	Orange	RS-232 RXD
E	White	RS-232 TXD**
F	Brown	Signal Ground
G	No Connection	Not Used
H	No Connection	Not Used
J	No Connection	Not Used
K	No Connection	Not Used
No Connection	Green	Not Used
No Connection	Blue	Not Used

**User Receives data from this line

Wiring direction for the mating cable GGC Cable –65)

1) The Black wire is attached to the power supply Ground.
2) The Red wire is attached to Power Supply V+ (unit will work from +18 to +35 VDC).
3) The Orange wire is attached to the computers RS-232 transmit line (pin 3 on the 9-pin D-sub RS-232 connector).
4) The White wire is attached to the computers RS-232 receive line (pin 2 on the 9-pin D-sub RS-232 connector).
5) The Brown wire is attached to the computers RS-232 signal ground line (pin 5 on the 9-pin D-sub RS-232 connector).

Note: The Green and Blue wires remain unconnected.

Specifications

Attitude

Range: Bank	±180°	
Range: Elevation	±75°	
Resolution:	0.02°	Binary mode (14 bit)
Accuracy: Static	±0.25°	
* Accuracy: Dynamic	±0.5%	

GPS Heading

Range:	0° - 360°	
Resolution:	0.02°	Binary mode (14 bit)
Accuracy: Static	±0.3°	Using GPS
* Accuracy: Dynamic or Relative	±0.5%	±0.05°/sec (without GPS)

Angular Rate

Range: Roll, Pitch, Yaw	±100°/sec	
Resolution:	0.025°/sec	Binary mode (14 bit)
Scale Factor Accuracy:	0.5%	
Bias: Roll, Pitch, Yaw	< 0.1°/sec	Digital ASCII
Non-Linearity:	< 0.1%	Full scale range
Bandwidth:	20 Hz	
Noise:	< 0.03°/sec rms	

Acceleration

Range: X, Y, Z	±10g	
Range: Forward, Lateral, Vertical	±10g	
Resolution:	4mg	
Scale Factor Accuracy:	1%	
Bias: X, Y, Z	< 10mg	
Non-Linearity:	0.1%	Full scale range
Bandwidth:	3 Hz	

GPS Positioning

Range: Latitude	±90°	
Range: Longitude	±180°	
Range: Altitude	0ft to 21500ft	
Resolution: Latitude, Longitude	0.00001 minutes	
Resolution: Altitude	2 ft	
Accuracy: Latitude, Longitude	±0.6m (with DGPS)	±2.5m (without DGPS)

Environmental

Temperature: Operating	-30°C to +70°C	
Temperature: Storage	-55°C to +85°C	
Vibration: Operating	5g rms	20 Hz to 2 KHz
Vibration: Survival	10g rms	20 Hz to 2 KHz
Shock: Survival	500g	10mS ½ sine wave

Electrical

Frame Rate:	71.1 Hz	Maximum
Startup Time: Data	5 sec	
† Startup Time: Satellite Acquisition	5 min	Typical
‡ Input Power:	18 to 35VDC	7.0W
Input Current:	240mA @ 28VDC	280mA @ 24VDC
Digital Output:	RS-232	

Physical

Axis Alignment:	< 0.1°	
Size: Antenna Stowed	24.3"W x 19.5"L x 8.7"H	61.7 x 49.5 x 22.1 (cm)
Weight:	37lb	16.8Kg
Connection:	MS3112E12-10P	Mating: MS3116F12-10S

* Using velocity data with GPS mode on.
   Actual accuracy can be calculated as the listed percentage multiplied by the change in value over the entire dynamic maneuver.
† Acquisition time for GPS units is typical for the contiguous United States. Acquisition time may differ due to interference in your geographic area.
‡ Including losses using 65 meter cabling.
•   Specifications are subject to change without notice.
•   This product may be subject to export restrictions. Please consult the factory.

Warning

Rough handling, dropping, or miswiring this unit is likely to cause damage.

DISCLAIMER
The information contained in this manual is believed to be accurate and reliable; however, it is the user's responsibility to test and to determine whether a Watson Industries' product is suitable for a particular use.

Suggestion of uses should not be taken as inducements to infringe upon any patents.

WARRANTY
Watson Industries, Inc. warrants, to the original purchaser, this product to be free from defective material or workmanship for a period of two full years from the date of purchase. Watson Industries' liability under this warranty is limited to repairing or replacing, at Watson Industries' sole discretion, the defective product when returned to the factory, shipping charges prepaid, within two full years from the date of purchase. The warranty described in this paragraph shall be in lieu of any other warranty, express or implied, including but not limited to any implied warranty of merchantability or fitness for a particular purpose.

Excluded from any warranty given by Watson Industries are products that have been subject to abuse, misuse, damage or accident; that have been connected, installed or adjusted contrary to the instructions furnished by seller; or that have been repaired by persons not authorized by Watson Industries.

Watson Industries reserves the right to discontinue models, to change specifications, price or design of this product at any time without notice and without incurring any obligation whatsoever.

The purchaser agrees to assume all liabilities for any damages and/or bodily injury that may result from the use, or misuse, of this product by the purchaser, his employees or agents. The purchaser further agrees that seller shall not be liable in any way for consequential damages resulting from the use of this product.

No agent or representative of Watson Industries is authorized to assume, and Watson Industries will not be bound by any other obligation or representation made in connection with the sale and/or purchase of this product.

PRODUCT LIFE
The maximum expected life of this product is 20 years from the date of purchase. Watson Industries, Inc. recommends the replacement of any product that has exceeded the product life expectation.

Customer Service

All repairs, calibrations and upgrades are performed at the factory. Before returning any product, please contact Watson Industries to obtain a Returned Material Authorization number (RMA).

Return Address & Contact Information

Watson Industries, Inc.
3035 Melby Street
Eau Claire, WI 54703
ATTN: Service Department
Telephone: (715) 839-0628   Fax: (715) 839-8248   email: support@watson-gyro.com

Returning the Product

Product shall be packaged making sure there is adequate packing around all sides. Correspondence shall include:
- Customer's Name and Address
- Contact Information
- Equipment Model Number
- Equipment Serial Number
- Description of Fault

It is the customer's responsibility to pay all shipping charges from customer to Watson Industries, including import and transportation charges.

Appendix A

The following data items are available in the Optional RS-232 Digital Output. Their full-scale ranges are listed. See Appendix B for more information.

Inertial Output	Full Scale Decimal
Time	UTC [1] HHMMSS
Bank Angle	±179.9º
Elevation Angle	±89.9º
Heading Angle	0.0 to 359.9º
X Accelerometer	±9.99 G
Y Accelerometer	±9.99 G
Z Accelerometer	±9.99 G
Forward Acceleration	±9.99 G
Lateral Acceleration	±9.99 G
Vertical Acceleration	±9.99 G
X Angular Rate	±99.9 º/s
Y Angular Rate	±99.9 º/s
Z Angular Rate	±99.9 º/s
Heading Rate	±99.9 º/s
Ground Track [2] / Forward Velocity	±399.9 Km/hr
Latitude [3]	±89.99999
Longitude [3]	±179.99999
Altitude [4]	21500 Feet
Temperature	-40º to 88ºC
Status Bits	3 ASCII chars representing Octal digits
Flag Bits	3 ASCII chars representing Octal digits

[1] Note: The GPS universal time (UTC) field is filled with asterisks when the data is invalid. ("******")

[2] Note: The Ground Track Velocity field is filled with asterisks when the data is invalid. (****.*)

[3] Note: The Latitude and Longitude fields are filled with asterisks when the data is invalid. ("****.*****,* *****.*****,*")

[4] Note: The Altitude field is filled with asterisks when the data is invalid. (*****)

The Status Bits contain the following information:

       Bit   Description (If Set)
- 0   Bank Error Flag
- 1   Elevation Error Flag
- 2   Heading Error Flag
- 3   System Error Flag
- 4   Velocity Error Flag
- 5   Ready Flag
- 6   Checksum Error Flag

```
e.g.   Status = 040(octal)  =    0 100 000   (binary)
       bit 6 is reset – No Checksum Error
       bit 5 is set   – Ready
       bit 4 is reset – No Velocity Error
       bit 3 is reset – No System Error
       bit 2 is reset – No Heading Error
       bit 1 is reset – No Elevation Error
       bit 0 is reset – No Bank Error
```

The Flag Bits contains the following information:

       Bit   Description (If Set)
- 0   GPS ground track heading data loss
- 1   GPS ground track velocity data loss
- 2   GPS true heading data loss
- 3   Reference Command selected
- 4   GPS enabled
- 5   Free Mode selected
- 6   Logic Input Switches disabled

```
e.g.   Flags = 120(octal)  =    1 010 000   (binary)
       bit 6 is set   –  Logic Input disabled
       bit 5 is reset – not in Free Mode
       bit 4 is set   – GPS enabled
       bit 3 is reset – not in Reference Mode
       bit 2 is reset – valid GPS true heading data
       bit 1 is reset – valid GPS ground track velocity data
       bit 0 is reset – valid GPS ground track heading data
```

Watson Industries, Inc.   GGC-E101 Rev A 12/16/2015

Appendix B

Activating Command mode or Double Spacebar Access to commands

Hook the unit up to your computers serial port.
Use HyperTerminal program to interface with unit.

Turn on unit. Wait for the startup message to appear on display.
Hit the space bar twice within the first 5 seconds of turn on.
Sometimes it takes a few tries to get the hang of this.
Wait 15 seconds.

Now the unit will take in the keyboard commands.

Determining and Setting Output Channels
For Optional RS-232 Digital Output

Activate Command Mode (See above).
To determine which channels are present, first type '&'.
This will bring up the menu:

```
TYPE IN THE NUMBER OF YOUR SELECTION (OR 'Q' TO QUIT):
    1 = ADJUST TIME CONSTANTS
    2 = SET OUTPUT CHANNELS
    3 = LIST CURRENT OUTPUT CHANNEL SELECTION
    4 = SELECT HEADING SOURCE
    5 = SET NEW BAUD RATE
```

Typing '3' will show which channels are currently active.

To change which channels are output, type '&' (this will bring up the menu again).

Now type '2' to set up the channels.
The following message will appear:

```
        TO SET FOR OUTPUT FOR ANY OF THE FOLLOWING DATA ITEMS, PRESS Y
        TO AVOID ANY OF THE FOLLOWING DATA ITEMS, PRESS N
        TO QUIT AND DISREGARD ANY OTHER DATA, PRESS Q

        *** DO YOU WANT TO PROCEED?  (Y/N/Q)
```

To proceed type 'Y' or 'y'
Now each channel will come up one at a time.
For example:

```
  DO YOU WANT OUTPUT OF TIME?
```

Type 'Y' or 'y' to output the channel, type 'N' or 'n' to remove the channel.
When you get to bottom of list, this message will appear:

```
        Y = GOBACK, N = INSTALL DATA & QUIT, Q = QUIT
    DO YOU WANT TO TRY TO SET DATA AGAIN?
```

To accept the channels as selected, type 'N' or 'n', then press the space bar to resume data output.

To make this channel selection the default the next time you power the unit on type " (a quote mark).

Setting Output Format

There are two output formats:
>   Optional Decimal ASCII output – '_' Command.
>   Standard output – '%' Command.

To change the output format:
>   Activate Command Mode (See above).
>   Press the key Command corresponding to the format you want to switch into.

To make this output selection the default the next time you power the unit on type " (a quote mark.)

Setting Heading Mode

Activate Command Mode (See above).
To set the heading mode, type '&'.
This will bring up the menu:

```
TYPE IN THE NUMBER OF YOUR SELECTION (OR 'Q' TO QUIT):
     1 = ADJUST TIME CONSTANTS
     2 = SET OUTPUT CHANNELS
     3 = LIST CURRENT OUTPUT CHANNEL SELECTION
     4 = SELECT HEADING SOURCE
     5 = SET NEW BAUD RATE
```

Typing '4' will bring up this menu:

```
     SELECTION HEADING SOURCE (OR 'Q' TO QUIT):
 1 = GPS TRUE NORTH HEADING (GPHDT GPS Message Required)
 2 = RELATIVE HEADING
```

To set the heading mode to GPS True North Heading type '1'.

To set the heading mode to Relative Heading type '2'

To make any of these modes the default the next time you power the unit on type " (a quote mark.)
